

Moving from Latch

Everything you run on Latch runs on Coalescent Cloud at a fraction of the cost — and we'll migrate you, free.

SUMMARY

Your pipelines are Nextflow and your files are ordinary S3 storage, so there is no lock-in to unwind — moving is mostly copying data. Here's how it goes:

- 1 Email us**
 Send your rough data size and the pipelines you run to **derek@coalescent.cloud**
- 2 We move your data**
 We copy it into your new bucket for you — big transfers run unattended overnight. Buckets you already own keep working as they are.
- 3 We set up your workspace**
 Instances, teammates and roles, and your first pipeline running end-to-end. You watch it work before committing to anything.
- 4 You switch when it's proven**
 You pay nothing until you're fully moved — up to **\$5,000 in migration credits** covers the switch. No migration is too small.

Coalescent Cloud is owner-operated and profitable, and we run our own hardware. No egress fees, ever — downloading your data, sharing across clouds, or leaving later is free.

CONCEPT MAP

On Latch	On Coalescent Cloud
Latch Data (Latch:// paths, file browser)	Buckets — S3-compatible storage with a built-in file browser, usable from any S3 client
Mounted data (Latch Data on Pods, S3/GCP buckets)	Your bucket is mounted at ~/personalbucket on every instance (plus ~/orgbucket for your org's shared bucket); S3/GCP buckets you already own keep working, or we copy them in for you
Workflows (Nextflow via the Latch SDK)	Native Nextflow — run plain nf-core or your own pipelines with no SDK, no registration step, no wrapper code, at roughly 10–20x lower compute cost
Pods (JupyterLab, RStudio)	Instances — JupyterLab, RStudio Server, Marimo notebooks, and SSH containers; live-resizable without a restart, and clonable for a teammate
Pod GPUs (A10G, T4, V100, L40s)	Blackwell GPUs, just added to the fleet — available in notebooks and compute containers
Workspaces & Organizations	Organizations — shared credit pool, admin/member roles, per-member spend caps, required 2FA
Registry (sample sheets, metadata)	Samplesheets live as CSVs in your bucket — which is what Nextflow pipelines consume anyway
Plots (interactive dashboards)	Marimo — reactive notebooks that deploy as interactive apps

PRICING VS LATCH

20× cheaper CPU \$0.21 → \$0.01 per vCPU-hr	2× cheaper RAM \$0.01 → \$0.005 per GiB-hr	2.5× cheaper storage \$23 → \$9 per TB-mo	\$0 egress fees downloads & sharing always free
